

CKYC API Integration — Client Onboarding Implementation

Domain: KYC Compliance | CKYC Registry | Banking Onboarding

Tools Used: Postman | REST API | BPMN Process Mapping | MS Excel | MS PowerPoint

Problem Statement

A banking client's onboarding team was manually collecting KYC documents from every new customer — even for customers who already had verified KYC records in the Central KYC registry. This caused duplication of effort, longer onboarding TAT, and inconsistent data quality.

My Role

Business Analyst responsible for end-to-end implementation — from client requirement gathering through sandbox UAT, API integration validation, and production go-live.

Approach

Step 1 — Requirement Gathering

Conducted stakeholder workshops with the client's compliance team and technology team to understand their existing onboarding workflow, identify pain points, and define the desired future state using CKYC API integration.

Step 2 — Gap Analysis

Mapped As-Is onboarding process against the To-Be CKYC-integrated flow — identifying 3 manual steps eliminated by automation: physical document collection, manual data entry, and compliance officer review for existing KYC customers.

Step 3 — API Specification Documentation

Documented complete CKYC Search API requirements including request parameters (PAN, Aadhaar, name, date of birth), response field mapping, error code handling, SLA requirements, and retry logic for timeout scenarios.

Step 4 — Sandbox UAT

Prepared UAT test scenarios covering: successful CKYC search with existing record, no-match

scenario triggering manual KYC flow, API timeout handling, and data field validation. Coordinated client testing team through sandbox environment and obtained formal UAT sign-off.

Step 5 — Production Go-Live

Managed production release coordination, confirmed environment readiness, validated live API responses, and handed over to post-production support.

Outcome

- Reduced customer onboarding TAT by eliminating manual document collection for returning customers
- Eliminated manual data re-entry errors through automated CKYC data population
- Zero critical defects at production go-live
