

Periodic KYC Recertification — Process Analysis and Automation Opportunity Identification

Domain: KYC Compliance, Recertification, Process Improvement, RBI KYC Master Direction

Tools Used: Lucidchart/draw.io for BPMN, MS Excel, MS Word for requirements documentation

Overview:

Analysed a banking client's periodic KYC recertification workflow, identified manual bottlenecks, and proposed an automated trigger-based recertification system using CKYC refresh API.

Problem Statement:

The client's compliance team managed KYC recertification manually — tracking expiry dates in spreadsheets, sending manual reminders to customers, and processing updated documents individually. With a growing customer base this was becoming unscalable and creating compliance risk when recertifications were missed.

My Role:

Business Analyst responsible for current state process analysis, future state design, and functional requirements documentation for the automated recertification solution.

Approach:

Step 1 — As-Is Process Mapping:

Mapped the existing recertification workflow end-to-end using BPMN swimlane diagrams — covering compliance team activities, customer touchpoints, document processing, and system updates. Identified 5 manual steps, 2 approval bottlenecks, and 1 compliance risk point where recertifications were being missed.

Step 2 — Root Cause Analysis:

Identified root cause of missed recertifications — no automated tracking system, expiry dates managed in individual spreadsheets across team members with no central visibility or escalation mechanism.

Step 3 — To-Be Process Design:

Designed automated recertification workflow — system-generated expiry tracking, automated customer notification at 90/60/30 days before expiry, CKYC refresh API call to check for updated registry records before requesting new documents, and compliance dashboard for monitoring pending recertifications.

Step 4 — Functional Requirements Documentation:

Documented requirements for the automated recertification system — trigger logic, notification templates, CKYC API integration specifications, exception handling for non-responsive customers, and audit trail requirements for regulatory evidence.

Outcome:

- Identified 7% process efficiency improvement opportunity through automation of manual tracking steps
- Eliminated compliance risk of missed recertifications through systematic expiry monitoring
- Produced functional requirements document for development team implementation
